## Given:

- Pool of documents (all my documents)
- Library of books (all my books)
- Tools to draw
- Internet websites (depending on an address), Git, Computer
- Chat logs

## Situations:

### Task 101:

I have a library of books. I want to take the first fantasy book I have not read yet and read it for 3 hours. Then, I want to put it back into the library.

### Task 102:

I am working on a license. I want to take all books related to licensing from my library and find everything relevant to GPL license from those books, as aggregated information.

### Task 103:

I want to draw a chicken. I need a pencil, an eraser and I need to find some reference images in the internet. Please provide it to me in the form of a structure: (drawing tools, 5 printed reference images).

### Task 104:

I have a pool of documents. I want to get only invoices – those I have not paid yet. Then I want to pay those invoices using the bank website. To do that, I must pass authentication (login, pass) and input all important details, of course. Every invoice contains all necessary information (like, account numbers et al).

### Task 105:

I have some chat logs structured in a way of: "id – display name – chat message".

I want to know who was talking about how amazing my chicken pictures are.

Then I want to get all relevant information and make it an attractive collage (from text) – and I want to add it to gitlab for everyone to see.
